NEO

INTEGRATED HEALTHCARE TECHNOLOGY

Homepage Design Direction

Art direction, layout guidance, responsive behaviour, motion and design handover

Purpose
Practical working brief for NEO's design, webmaster, content and development teams.

Working document | 02 November 2026

1. Design objective

Create a premium, international healthcare technology corporate experience. It should feel confident, calm, human-centred and technologically capable. Avoid looking like a hospital website, a consumer health app or a generic software landing page.

Express three ideas: healthcare is human; technology connects; NEO is building for the long term.

2. Homepage art direction

Element	Direction	Avoid
Overall mood	Premium, minimal, confident, editorial	Clutter, playful visuals, generic template appearance
Hero visual	Abstract connected healthcare visual or art-directed human/technology scene	Unverified photos implying NEO-owned facilities or teams
Photography	Authentic healthcare professionals, modern care environments, natural light	Generic staged stock imagery
Graphics	Subtle network lines, data patterns, soft gradients, restrained geometry	Neon grids, excessive glow and decorative animation
Cards	Simple, consistent, spacious, clear hierarchy	Too many card styles and heavy shadows
Motion	Subtle purposeful transitions	Autoplay sound, parallax overload and distraction

3. Section-by-section notes

Hero

Strong left-aligned headline and short supporting paragraph. Two actions: Explore Our Solutions and Partner With NEO. Visual on right or as art-directed background; maintain text contrast.

Who We Are

Editorial two-column layout: concise introduction and one meaningful visual. Avoid long company history on homepage.

Five pillars

Five consistent modules with short headings, simple line icons or numbered markers and one-sentence descriptions. Do not imply all capabilities are fully launched.

KHAYR feature

Use approved product UI or clearly labelled concept UI. Include short description, Explore KHAYR CTA and development-stage note.

Technology and approach

Use restrained diagrams or visual principles to explain integration, scalability, responsible data handling and intelligent workflows. Do not publish detailed architecture or security claims without approval.

Partnership and footer

Use a distinct dark CTA section with one clear action. Footer should contain corporate signature, compact navigation, approved contact details and legal links.

4. Responsive behaviour

Viewport	Design requirement
Large desktop	Wide container, spacious hero, two-column layouts, generous whitespace.
Laptop / tablet landscape	Reduce column widths and typography carefully; preserve hierarchy.
Tablet portrait	Stack selected columns; two-column cards only where readable.
Mobile	Single-column flow, concise hero, touch-friendly controls, no horizontal overflow, readable cards and visible contact path.

Define actual breakpoints in the design system and test common viewport widths. A desktop screenshot alone does not demonstrate responsive design.

5. Motion and interaction

• Hover states for links and cards, with keyboard equivalents.

• Subtle reveal animations only if they do not delay access.

• Respect reduced-motion preferences.

• Avoid carousels for key messages.

• Provide clear loading, validation, success and error states on forms.

6. Image and asset requirements

• Official NEO logo in SVG and transparent PNG.

• Approved KHAYR product UI screenshots or labelled concept mock-ups.

• Approved company/team imagery, if available.

• Licensed stock or commissioned visuals with usage rights documented.

• Custom icons and diagrams in editable SVG format.

• Image alt-text inventory and image optimisation.

Never use third-party facility or partner imagery in a way that implies ownership, endorsement or partnership without permission.

7. Design handover deliverables

• High-fidelity desktop homepage design.

• High-fidelity mobile homepage design.

• Design system and component library.

• Navigation states and responsive menu.

• Buttons, cards, forms, footer and language selector.

• Hover, focus, error, success and disabled states.

• Asset folder with source files and usage rights.

• Annotated handoff with spacing, typography, colours and responsive rules.
