NEO

INTEGRATED HEALTHCARE TECHNOLOGY

Visual Identity & Design System

Colour palette, typography, layout, components, accessibility and design handover

Purpose
Practical working brief for NEO's design, webmaster, content and development teams.

Working document | 02 November 2026

1. Visual identity principles

NEO's website identity should communicate a mature, international-minded healthcare technology company. The recommended direction is modern, restrained and human-centred.

• Clarity: strong typography and simple hierarchy.

• Confidence: deep navy foundation and controlled accents.

• Humanity: authentic healthcare imagery and approachable language.

• Technology: subtle blue/teal accents and structured visual motifs.

• Consistency: reusable components and strict design tokens.

2. Colour system

Token	Hex	Usage
Deep Navy	#071B35	Primary brand background, footer, high-contrast headings
Technology Blue	#147DB0	Primary links, interactive accents, section labels
Healthcare Teal	#24A6A0	Secondary accent and supportive graphics
Soft White	#F3F7FA	Page backgrounds and subtle panels
Pure White	#FFFFFF	Cards and clean surfaces
Body Text	#26384A	Main paragraph text
Muted Text	#526579	Supporting copy and metadata
Border / Divider	#DCE5EE	Rules, card borders and separators

This is a proposed website design direction, not confirmation of an already approved corporate brand standard. Check the palette against the official NEO logo and existing brand assets.

Colour usage

Use white and soft-white as primary content surfaces, deep navy for major brand moments and footer, blue for primary interaction, and teal sparingly. Avoid using all accents equally in every section.

3. Typography

Role	Recommendation	Usage
Display / H1	Manrope or Inter Bold	Hero and major page headings
H2 / H3	Inter or Manrope Semibold	Section and card titles
Body	Inter Regular	Paragraphs and descriptions
UI labels	Inter Medium	Navigation, buttons and form labels
Numbers	Inter Medium	Metrics only when verified and necessary

Starting scale: hero 48–64 px desktop and 34–42 px mobile; H1 40–48 px desktop; H2 28–36 px; H3 20–24 px; body 16–18 px; small labels 12–14 px. Tune through responsive prototypes and accessibility checks.

Use no more than two type families. Ensure font files are properly licensed and loaded efficiently.

4. Layout, spacing and grid

• Use a consistent max-width content container, approximately 1,160–1,280 px on large desktop as a starting point.

• Use a 12-column desktop grid and simpler mobile grid where appropriate.

• Adopt a 4 px spacing scale, for example 4, 8, 12, 16, 24, 32, 48, 64 and 96 px.

• Use consistent vertical spacing between sections.

• Set readable paragraph line lengths; avoid full-width long-form text.

These are design starting points. Document final container widths, breakpoints, gutters, spacing and component dimensions.

5. Components and states

Component	Variants / states
Header	Desktop; mobile; sticky/static; dropdown open; language selector
Buttons	Primary; secondary; text link; hover; focus; active; disabled
Cards	Business pillar; product; insight; partnership; hover/focus
Forms	Default; focused; invalid; submitting; success; error
Navigation	Default; hover; active; expanded dropdown; mobile menu
Footer	Desktop columns; mobile stacked layout
Content blocks	Text/image split; CTA; callout; article list

6. Iconography and imagery

Use a consistent line-icon family with matching stroke weights. Icons should support comprehension, not decorate every heading. Use authentic healthcare photography, carefully selected technology imagery and simple custom diagrams.

Do not use partner logos, client logos, certification marks or product imagery without rights and approval. Use descriptive alt text and optimise images.

7. Accessibility

• Target WCAG 2.2 AA for the public website.

• Maintain sufficient text and interface contrast.

• Provide keyboard navigation and visible focus indicators.

• Use semantic headings and meaningful link text.

• Label form fields and communicate errors in text, not colour alone.

• Support zoom and reflow without horizontal scrolling.

• Respect reduced-motion settings.

• Provide captions or transcripts for meaningful video content.

8. Design tokens and handover

Deliver a token sheet covering colour, typography, spacing, radii, shadows, breakpoints and component states. Name tokens semantically, e.g. color.brand.navy or text.body.primary, rather than arbitrary screen-specific names.

• Figma source file with organised pages and components.

• Desktop and mobile page designs.

• Design tokens and typography styles.

• Reusable component library with variants and states.

• Exported SVG/PNG assets and font licensing notes.

• Annotations for responsive behaviour and interaction.

• Accessibility notes and image alt-text guidance.

9. Brand governance

• Use official logo without distortion or unapproved recolouring.

• Keep NEO corporate identity distinct from KHAYR product identity.

• Use the same approved tagline and corporate descriptor across pages.

• Maintain one approved source of truth for colours, fonts, logos and content.

• New claims, metrics, partner logos, certifications and customer references require internal approval.
